

This update brings significant enhancements to the Erthpot Keyer DSP, improving flexibility, control, and user interface responsiveness for audio professionals and system integrators.

New Features & Enhancements

1. Extended Input Gain Range

- Input gain now ranges from **0 dB to +51 dB**.
- *Previously limited to +24 dB to -27 dB, this expanded range allows greater control over input sensitivity.*

2. USB Routing Through ANS Algorithm in Matrix Mixer

- USB audio can now be routed **through the ANS (Adaptive Noise Suppression) algorithm** directly within the Matrix Mixer.
- *Previously, USB routing bypassed the ANS path.*

3. Volume Control for USB Input and Output

- Added volume control for both **USB IN and USB OUT** channels.
- *Users can now adjust USB levels directly from the interface, which was not possible earlier.*

4. Panel Configuration Window Resolution Fix

- The **Panel Configuration** window now displays correctly on all standard screen resolutions.
- *Earlier, users had to manually change desktop resolution to access and configure “PC 1.”*
